## Large-scale structure of complex networks (Part 2)

### └ Community structure in networks

#### What are communities?

- **Traditional definition:** Groups of nodes with a high internal link density
- **Modern definition:** Nodes with similar connection probabilities to the rest of the network

### What are communities?

- **Traditional definition:** Groups of nodes with a high internal link density
- **Modern definition:** Nodes with similar connection probabilities to the rest of the network

## └ Communities in the real-world networks

- ▶ **Social networks:**
  - Friend-circles
  - Research communities
  - Co-workers
- ▶ **World Wide Web:**
  - Pages with similar contents
  - Webpages under the same domain (e.g. Wikipedia)
- ▶ **Biological networks:**
  - Proteins with similar roles in protein interaction networks
  - Chemicals together taking part in chemical reactions in metabolic networks
  - Communities in neuronal networks

$$\mathbf{L} \left( \mathbf{s} + \frac{\mu}{\lambda}\mathbf{1} \right) = \lambda \left( \mathbf{s} + \frac{\mu}{\lambda}\mathbf{1} \right)$$

$\mathbf{1}$  is an eigenvector of the Laplacian with eigenvalue 0

$$\mathbf{L}\mathbf{x} = \lambda\mathbf{x}$$

# Spectral partitioning

$\mathbf{x}$  is an eigenvector of the Laplacian with eigenvalue  $\lambda$

Which eigenvector to choose?

$\mathbf{x}$  cannot be the eigenvector  $\mathbf{1} = \begin{pmatrix} 1 \\ 1 \\ \cdot \\ \cdot \\ 1 \end{pmatrix}$

$$\mathbf{1}^T \mathbf{x} = \mathbf{1} \left( \mathbf{s} + \frac{\mu}{\lambda} \mathbf{1} \right) = (n_1 - n_2) + \frac{\mu}{\lambda} n = 0$$

2017-12-30

## Large-scale structure of complex networks (Part 2)

### └ Spectral partitioning

$\mathbf{x}$  is orthogonal to  $\mathbf{1}$

.

$\mathbf{x}$  is eigenvector but not  $\mathbf{1}$

Spectral partitioning

$\mathbf{x}$  is an eigenvector of the Laplacian with eigenvalue  $\lambda$

Which eigenvector to choose?

$\mathbf{x}$  cannot be the eigenvector  $\mathbf{1} = \begin{pmatrix} 1 \\ 1 \\ \cdot \\ \cdot \\ 1 \end{pmatrix}$

$$\mathbf{1}^T \mathbf{x} = \mathbf{1} \left( \mathbf{s} + \frac{\mu}{\lambda} \mathbf{1} \right) = (n_1 - n_2) + \frac{\mu}{\lambda} n = 0$$

Which eigenvector to choose?

$$R = \frac{1}{4} \mathbf{s}^T \mathbf{L} \mathbf{s} = \frac{1}{4} \mathbf{x}^T \mathbf{x} = \frac{n_1 n_2}{n} \lambda$$

Choose the eigenvector with smallest possible eigenvalue!

Eigenvalues of the Laplacian are non-negative and smallest is always 0

$\mathbf{v}_1 = \mathbf{1}$  is ruled out already. So choose  $\mathbf{v}_2$  with the smallest positive eigenvalue

2017-12-30

└ Spectral partitioning

Which eigenvector to choose?  
 $R = \frac{1}{4} \mathbf{s}^T \mathbf{L} \mathbf{s} = \frac{1}{4} \mathbf{x}^T \mathbf{x} = \frac{n_1 n_2}{n} \lambda$   
Choose the eigenvector with smallest possible eigenvalue!  
Eigenvalues of the Laplacian are non-negative and smallest is always 0  
 $\mathbf{v}_1 = \mathbf{1}$  is ruled out already. So choose  $\mathbf{v}_2$  with the smallest positive eigenvalue

# Spectral partitioning

$$\mathbf{s} = x + \frac{n_1 - n_2}{n} \mathbf{1}$$

OR

$$s_i = x_i + \frac{n_1 - n_2}{n}$$

But  $s_i$  can be only  $\pm 1$

Thus, we want  $\mathbf{x}$  to be as close as possible to  $\mathbf{s}$

2017-12-30

## Large-scale structure of complex networks (Part 2)

└ Spectral partitioning

Spectral partitioning

$$\mathbf{s} = x + \frac{n_1 - n_2}{n} \mathbf{1}$$

OR

$$s_i = x_i + \frac{n_1 - n_2}{n}$$

But  $s_i$  can be only  $\pm 1$

Thus, we want  $\mathbf{x}$  to be as close as possible to  $\mathbf{s}$

# Spectral partitioning

Maximize:

$$\mathbf{s}^T \left( \mathbf{x} + \frac{n_1 - n_2}{n} \mathbf{1} \right) = \sum_i s_i \left( x_i + \frac{n_1 - n_2}{n} \right)$$

Equivalently, maximize:

$$\sum_i s_i x_i$$

Simply put the  $n_1$  vertices with most positive elements in group 1 and the rest ones in group 2

Group assignments are arbitrary

2017-12-30

## Large-scale structure of complex networks (Part 2)

### └ Spectral partitioning

Choose the assignment with the smaller cut size

Spectral partitioning

Maximize:

$$\mathbf{s}^T \left( \mathbf{x} + \frac{n_1 - n_2}{n} \mathbf{1} \right) = \sum_i s_i \left( x_i + \frac{n_1 - n_2}{n} \right)$$

Equivalently, maximize:

$$\sum_i s_i x_i$$

Simply put the  $n_1$  vertices with most positive elements in group 1 and the rest ones in group 2

Group assignments are arbitrary

## └ Spectral partitioning

- Calculate  $\mathbf{v}_2$  of the Laplacian
- Put vertices corresponding to largest  $n_1$  elements in group 1 and others in group 2. Calculate the cut size
- Put vertices corresponding to smallest  $n_1$  elements in group 1 and others in group 2. Calculate the cut size
- Choose the division with the smallest cut size among the two

- ▶ Calculate  $\mathbf{v}_2$  of the Laplacian
