

# Large-scale structure of complex networks (Part 2)

Snehal M. Shekatkar

Centre for modeling and simulation,  
S.P. Pune University, Pune

# Community structure in networks

# Community structure in networks

## What are communities?

- ▶ **Traditional definition:** Groups of nodes with a high internal link density
- ▶ **Modern definition:** Nodes with similar connection probabilities to the rest of the network

# Communities in the real-world networks

- ▶ **Social networks:**

- ▶ Friend-circles
- ▶ Research communities
- ▶ Co-workers

- ▶ **World Wide Web:**

- ▶ Pages with similar contents
- ▶ Webpages under the same domain (e.g. Wikipedia)

- ▶ **Biological network:**

- ▶ Proteins with similar roles in protein interaction networks
- ▶ Chemicals together taking part in chemical reactions in metabolic networks
- ▶ Communities in neuronal networks

# Community detection

## **Detecting communities is important!**

- ▶ Communities are building blocks of networks
- ▶ Communities allow us to see “the big picture”
- ▶ Functional/Autonomous units
- ▶ Non-trivial effects on the processes on networks

# Graph partitioning

Problem of dividing a graph in a given number of groups of given sizes such that the number of links between the groups is minimized

# Graph partitioning

Problem of dividing a graph in a given number of groups of given sizes such that the number of links between the groups is minimized

# Partitioning is hard!

- ▶ Graph with  $n$  vertices
- ▶ Find two groups with sizes  $n_1$  and  $n_2$  such that the cut size is minimum
- ▶ Number of ways:  $\frac{n!}{n_1!n_2!} \approx \frac{2^{n+1}}{\sqrt{n}}$

# Community detection is harder!

## ▶ **Graph partitioning**

- ▶ well defined
- ▶ Number of groups is fixed
- ▶ Sizes of the groups are fixed
- ▶ Divide even if no good division exists

## ▶ **Community detection**

- ▶ ill-defined
- ▶ Number of groups depends on the structure of the network
- ▶ Sizes of the groups depend on the structure of the network
- ▶ Discover natural fault lines

# Too many algorithms

- ▶ Girvan-Newman algorithm
- ▶ Modularity maximization
- ▶ Spectral decomposition
- ▶ Clique-percolation
- ▶ Random walk methods
- ▶ Statistical inference
- ▶ Label propagation
- ▶ Hierarchical clustering

# “The” simplest community detection problem

- ▶ Bisecting a graph with  $n$  nodes
- ▶ Group sizes are not fixed
- ▶ Minimum cut size?

# “The” simplest community detection problem

- ▶ Bisecting a graph with  $n$  nodes
- ▶ Group sizes are not fixed
- ▶ Minimum cut size?

**A different measure of the quality of division is required..**

# Quantification of community structure

- ▶ Fewer than expected edges between the groups

# Quantification of community structure

- ▶ Fewer than expected edges between the groups
- ▶ Equivalently, more than expected edges inside the groups

# Quantification of community structure

- ▶ Fewer than expected edges between the groups
- ▶ Equivalently, more than expected edges inside the groups
- ▶ Assortativity mixing and modularity

# Quantification of community structure

- ▶ Fewer than expected edges between the groups
- ▶ Equivalently, more than expected edges inside the groups
- ▶ Assortativity mixing and modularity
- ▶ Look for divisions with high modularity

# Quantification of community structure

- ▶ Fewer than expected edges between the groups
- ▶ Equivalently, more than expected edges inside the groups
- ▶ Assortativity mixing and modularity
- ▶ Look for divisions with high modularity
- ▶ Modularity maximization is hard

# Heuristic algorithms for modularity maximization

- ▶ **Agglomerative algorithms:**

- ▶ Hierarchical clustering
- ▶ Louvain method
- ▶ CNM algorithm

- ▶ **Divisive algorithms:**

- ▶ Girvan-Newman algorithm
- ▶ Radicchi algorithm

# Newman-Girvan algorithm

- ▶ Look for edges between the communities
- ▶ Edge betweenness

# Edge betweenness

- ▶ Path between two nodes
- ▶ Shortest path between two nodes
- ▶ Number of shortest paths that go through a given edge

# The algorithm

- ▶ Calculate betweenness for all edges
- ▶ Remove the edge with the highest betweenness
- ▶ Recalculate betweenness for all edges
- ▶ Repeat
